AB Title compds. I [R2, R3 = H, C1-4 alkyl; or R2R3 = (CH2)4 or (CH2)5] are prepared by an improved method. In particular, I are prepared in 4 steps, which may be carried out sep. or in a single pot. Specifically, (1) 5-fluorouracil (II) is treated with a silylating agent until it is completely solubilized; (2) the resultant silylated product III [R = H or trialkylsilyl, especially SiMe3] is treated with a β -D-ribose tetraester IV [R1 = alkanoyl, benzoyl, or benzoyl substituted with Me, OMe, NO2, F, Br, or Cl] in the presence of a condensing agent; (3) the obtained 5-fluorouridine triester V is hydrolyzed; and finally (4) the resulting 5-fluorouridine (VI) is treated with a ketone R2COR3 in an acidic medium. For example, in a one-pot preparation of I [R2 = R3 = Me] from II, using ClSiMe3 and HMDS in step 1, 1 β -D-tetraacetylribose in step 2, aqueous NH3

10/576,598

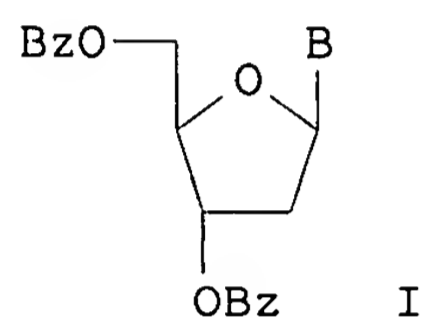

in MeOH in step 3, and acetone containing H₂SO₄ in step 4, an overall yield of approx. 70% was obtained, with a product purity of 99.7% by HPLC. Examples of the individual steps for the case of R₂ = R₃ = Me are also given. I are known intermediates for the cytostatic agent doxifluridine.

AB A stereocontrolled, de novo preparation of β -2'-deoxyribonucleosides, e.g. I (B = uracil, thymine), has been achieved. The process required just four steps from com. available 1,3,5-tribenzoyl- α -D-ribose and proceeded in high overall yield. The key synthetic strategy was the use of a m-trifluoromethylbenzoyl group at the 2-position of ribose to direct the glycosidation reaction and also serve as a deoxygenation precursor. The five 2'-deoxynucleosides that were synthesized were 2'-deoxyuridine, thymidine, 5-fluoro-2'-deoxyuridine, 5-trifluoromethyl-2'-deoxyuridine (trifluiridine) and 2'-deoxycytidine.

AB Title compds. I (R = alkyl; R1 = protective group, R2 = H) were prepared from the erythro isomers. Thus, erythro-pentofuranoside II (R1, R2 = H) was pivaloylated and mesylated to give II (R1 = Me3CCO, R2 = MeSO2) which was treated with BzONa to give I (R = Me, R1 = Bz, R2 = Me3CCO). The latter compound was debenzoylated, mesylated, and treated with Bu4NF to give fluoride III which was deacylated and deglycosidated to give 2,3-dideoxy-3-fluoro-D-erythro-pentose.

AB The first exptl. example of mechanochem. polymerization of specially synthesized solid-state monomers, methacryloyl derivs. of bioactive compds., I-III, is described. It has been shown, however, that there exists a monomer selectivity for efficiency of such reactions, although all the monomers studied undergo conventional solution polymns. using radical initiators. The detailed mechanistic implications on the reaction of I, as a representative example, have been clarified based on ESR kinetics on its comparison with that of the corresponding mechanoradical formation of I polymer, the progressive changes in mol. weight distribution including its heterogeneity, and kinetics of the polymer conversion. It has been shown that the mechanochem. polymerization involves a mechanoradical-initiated polymerization as a dominant process, and if one appropriate designs methacryloyl vinyl monomers along the line of the structural criteria derived from the quantum chemical considerations, one can make a variety of solid-state monomers undergo the mechanochem. polymns. essentially quant. Thus, the present result provides a novel and simple methodol. for polymeric prodrug syntheses of low heterogeneity through a totally dry process.
